Interactive Dashboard & Insight Report

What This Report Covers

Weeks 1 and 2 built and cleaned the dataset. Week 3 turned it into a live, interactive dashboard built in Looker Studio. This report explains what the dashboard shows, what the data tells us, and what actions the findings support.

The dashboard lets any team member filter by intake term, country, recruitment channel, or counselor and instantly see how those filters change every chart on the page. No data knowledge needed to use it.

All institution names, applicant names, contact details, and identifying information have been removed from this public version. The methodology, findings, and recommendations are fully preserved.

5,000	3,256	1,744	1,806
Total Applicants	**Admitted**	**Not Admitted**	**Counselor Contacts**
cleaned dataset	65.1% admission rate	many blocked, not rejected	36.1% of applicants reached

Section 1: How the Dashboard Is Built

The dashboard is a single page built in Looker Studio. It flows from top to bottom summary numbers first, detail charts below. Every chart answers one specific question about the data.

The Filter Strip

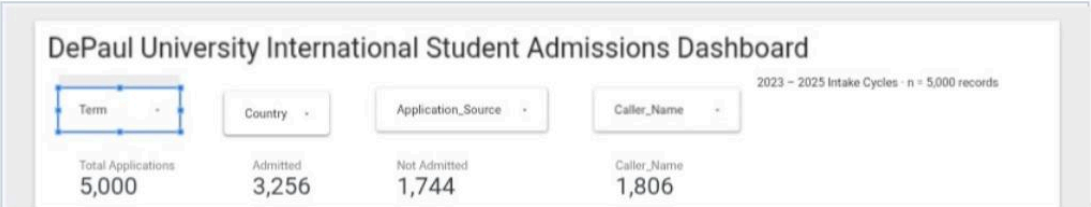
Four dropdown menus sit at the top of the dashboard. Every chart on the page updates the moment you change any filter. You do not need to touch individual charts.

Filter	What It Does
Term filter	Isolate one intake cycle e.g. show only Fall 2024 across all charts
Country filter	Show one country's full profile volume, programs, conversion rate, and counselor contacts all update at once
Application Source filter	Separate Study Group from Non Study Group applicants across every chart
Counselor filter	Show one counselor's contacts and outcomes only useful for workload reviews

Screenshot 1: Dashboard Overview Filters and Key Numbers

This is what a viewer sees first when they open the dashboard. Four filter dropdowns across the top, then four headline numbers below them.

Admitted, 1,744 Not Admitted, 1,806 Contacts.



What to Notice

The four numbers 5,000 total, 3,256 admitted, 1,744 not admitted, 1,806 contacts update instantly when any filter is applied. A recruitment manager selecting a single country will see that country's exact figures in seconds.

How Each Chart Was Built

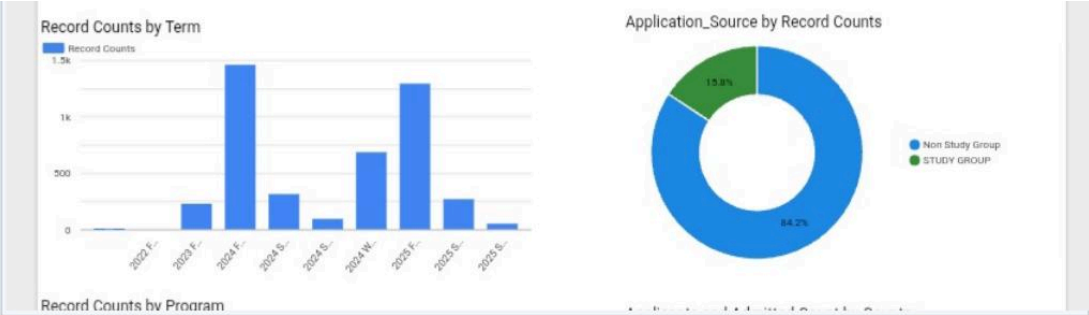
Each chart type was chosen to match the shape of the data it displays.

Chart	Why That Type Was Used
KPI Scorecards	Single headline numbers total applicants, admitted, not admitted, contacts
Bar Chart (Term)	Compares application volume across ordered time periods
Donut Chart (Source)	Shows the two-part split between recruitment channels
Horizontal Bar (Programs)	Ranks many program names clearly easier to read than a vertical chart
Grouped Bar (Country)	Compares two numbers side by side per country total vs admitted
Table (Conversion Rate)	Shows precise percentages with colour coding green above 60%, orange 40-59%, red below 40%
Pie Chart (Counselors)	Shows each counselor's share of total outreach contacts
Horizontal Bar (Outcomes)	Ranks eight outreach outcome categories by volume

Section 2: What the Data Shows

Finding 1: Fall Is the Peak Intake By a Large Margin

Application volume is not spread evenly across intake periods. Fall dominates. The gap between Fall and other terms is large enough to have direct staffing and budget implications.



The Numbers

Fall 2023: 227 applications. Fall 2024: 1,459 applications a 54.2% increase in one year. Fall 2025: already at 1,292 with intake still open. Winter is the second-largest period. Spring and Summer combined across all years total less than 800 applications.

What This Means for Recruitment

Counselor capacity and marketing budget should concentrate in the 3 months before each Fall deadline. Spring and Summer do not require the same level of resource. Using the Term filter in the dashboard each quarter allows direct comparison of the current intake pace against the prior year.

Finding 2: Most Applicants Come Through One Channel

Two recruitment channels exist: Study Group and Non Study Group. They are not equal in volume.

Channel	Volume and Share
Non Study Group	4,212 applications _84.2% of total volume

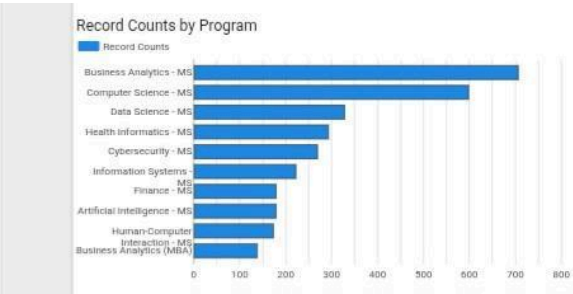
Study Group	788 applications _ 15.8% of total volume

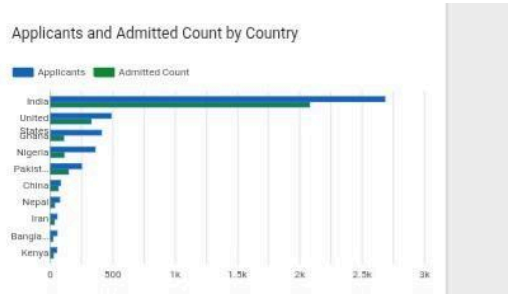
What This Means

Non Study Group drives the majority of applications. Study Group applicants concentrate in Business Analytics MS and Computer Science MS. Non Study Group warrants the larger share of recruitment investment. Study Group may benefit from targeted messaging toward the specific programs where it already performs.

Finding 3: Where Applicants Come From and Which Countries Convert

Application volume and admission success rate are two different things. The chart and table below show both together.





Conversion Rate by Country

	Country	Conversion Rate
1.	China	7,926.83%
2.	India	7,749.63%
3.	United States	6,707.57%
4.	Iran	6,181.82%
5.	Pakistan	5,833.33%
6.	Kenya	5,000%
7.	Nepal	4,675.32%

1 - 10 / 10

The Numbers

One country accounts for 2,684 applicants (53.7% of the cleaned dataset) at a 77.5% conversion rate. Two West African countries together submit 773 applications but produce

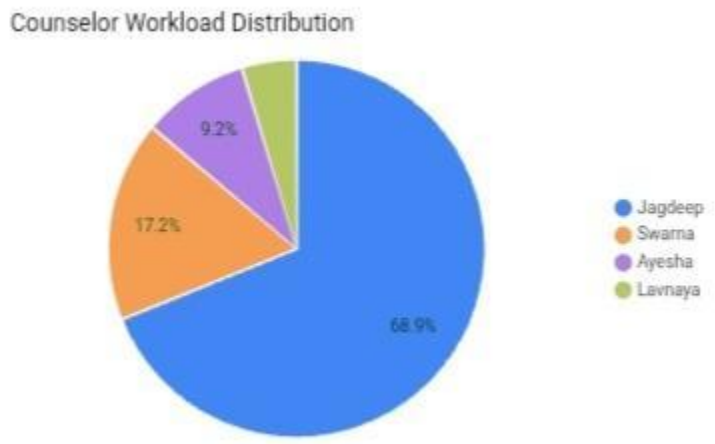
only 221 admissions a combined conversion rate of 28.6%. China leads on conversion at 79.3% despite lower volume.

What This Means

High volume and high conversion in one country means that investment there is well-placed. The two low-converting countries are not low-qualifying. They submitted applications, which shows intent. The block is documentation. Their conversion rate is a process problem, not a demand problem.

Finding 4: One Counselor Handles Most of the Work

Four counselors manage all outreach. Their workload is not balanced.



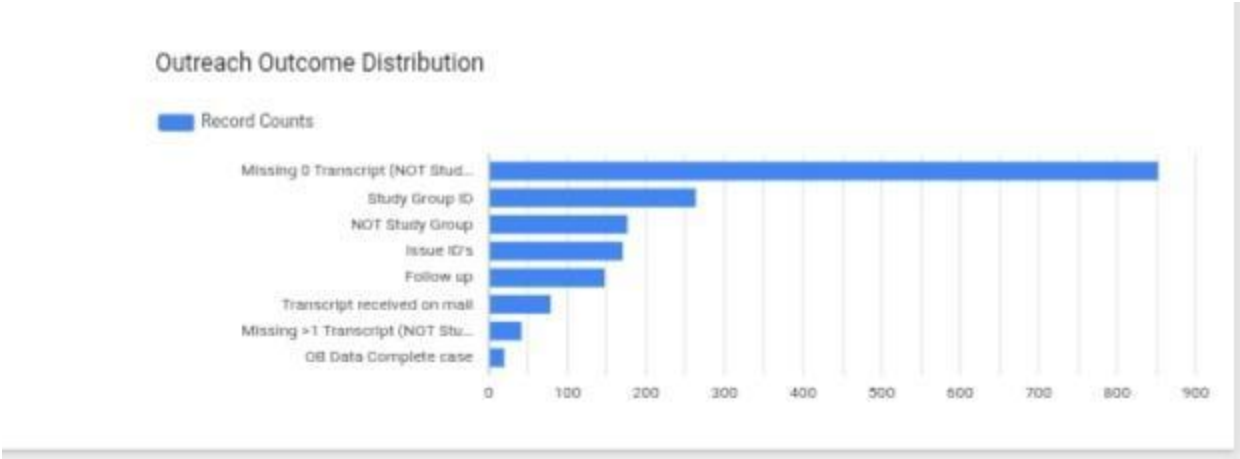
Counselor	Contacts and Share
Jagdeep	1,244 contacts — 68.9% of all outreach
Swarna	311 contacts — 17.2%
Ayesha	166 contacts — 9.2%
Lavnaya	85 contacts — 4.7%

What This Means

One person handling 68.9% of all outreach is a structural risk. If that counselor is unavailable, the majority of applicant contact stops. Lavnaya and Ayesha both have available capacity. Neither country with the lowest conversion rate currently has a dedicated counselor.

Finding 5: Missing Documents Block More Admissions Than Rejections

The most common outreach outcome is not a rejection. It is a missing document.



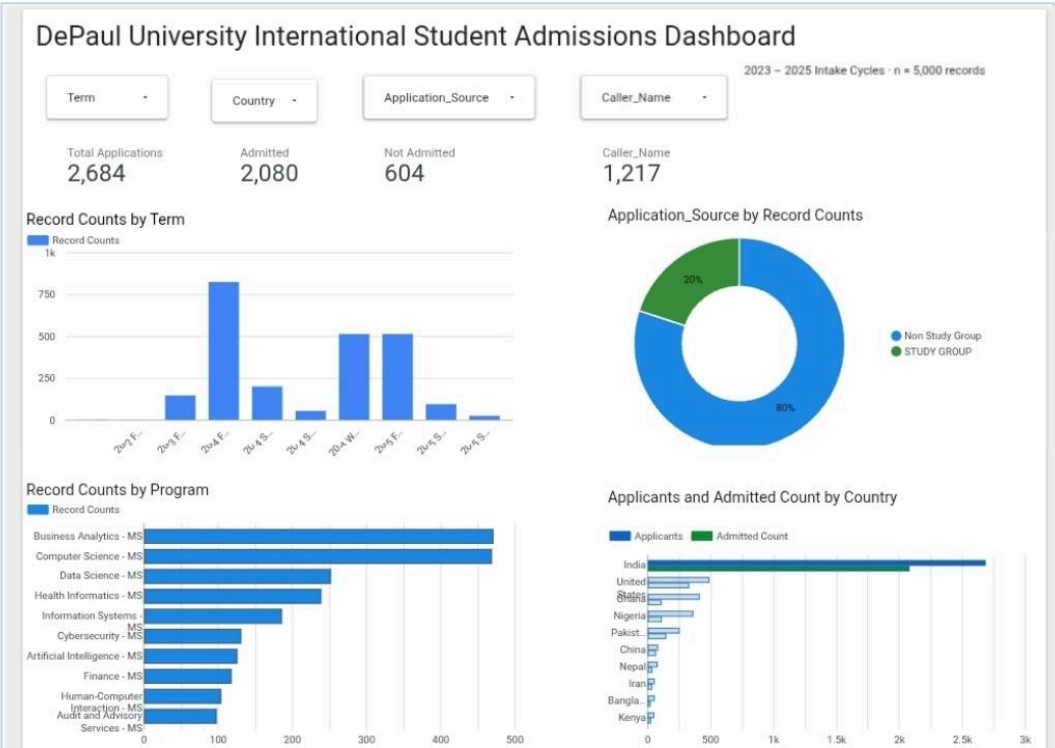
Outcome Category	Count and Significance
Missing transcripts (none on file)	853 records 17.1% of all applicants
Missing transcripts (partial)	42 records
Total missing transcript records	(895)17.9% of all 5,000 applicants
Follow-up contacts	(148) records all 148 converted to admitted

The Most Important Number in the Dataset

Every single follow-up contact produced an admitted student. 148 follow-ups produced 148 admissions. A 100% conversion rate on follow-up contacts is the strongest signal in the data. It confirms that counselor engagement after initial contact directly produces admissions.

Dashboard in Action Full View

The screenshot below shows the full dashboard with the Country filter set to one country. Every chart has updated to show only that country's data. This is the dashboard working as intended one click, full country profile, no queries needed.



What a Recruitment Manager Can Do With This

Select any country from the Country dropdown. Instantly see that country's application volume, admitted count, program breakdown, intake trend, and counselor contact history. The time between a question and its answer is reduced to seconds. No analyst needed in the room.

Section 4: Four Recommendations

Each recommendation below comes directly from a specific number in the dataset. The evidence column shows exactly where in the dashboard each decision is supported.

Recommendation 1: Build a Transcript Reminder System

895 applicants have a missing or incomplete transcript on file. These applicants already submitted an application they want to study. The block is paperwork, not eligibility. This is recoverable volume.

Action: Trigger an automated reminder email at 7, 14, and 21 days after submission when the admission date is blank and the outcome shows a missing transcript. Assign one counselor specifically to the two low-converting countries neither currently has a dedicated contact.

Evidence: 895 missing transcript records. Two-country combined conversion rate of 28.6%. Recovering 50% of those 773 applicants adds approximately 220 additional admitted students per intake cycle.

Recommendation 2: Rebalance Counselor Workload

One counselor handling 68.9% of all contacts is a single point of failure. Three other counselors have available capacity and are currently underutilised. The imbalance is a staffing risk and a service quality risk.

Action: Assign the two lowest-volume counselors as primary contacts for the two low-converting countries. Their current contact volumes (85 and 166) leave room for additional cases. Target distribution: lead counselor reduced to 45%, others at 25%, 20%, and 10%.

Evidence: Lead counselor: 1,244 contacts (68.9%). Lowest-volume counselor: 85 contacts (4.7%). Use the Counselor filter in the dashboard to track the rebalance each month.

Recommendation 3: Concentrate Campaigns on Fall and Winter

Fall 2024 generated 1,459 applications. Fall 2025 is already at 1,292. Spring and Summer combined across the entire dataset total less than 800. The data is clear about where demand concentrates.

Action: Concentrate marketing spend in the 3 months before each Fall deadline. Use the Term filter each quarter to compare the current intake pace against the prior year. Spring and Summer do not require the same counselor capacity or budget.

Evidence: Fall 2024: 1,459 applications. Summer 2025: 50 applications. Applications by Term chart, dashboard Row 2.

Recommendation 4: Apply the Follow-Up Protocol to All Pending Applicants

148 follow-up contacts produced 148 admissions. The conversion rate on follow-up is 100%. This is not a small sample effect it is a consistent finding across the dataset. The follow-up workflow works.

Action: Apply the follow-up workflow to every applicant where the admission date is blank and the outcome is not a hard rejection. Use the Outcome Distribution chart to identify which outcome categories have the most records and prioritise those first. Track the monthly follow-up conversion rate to confirm the 100% rate holds at higher volume.

Evidence: 148 Follow Up outcome records. 148 corresponding admission dates filled. Outcome Distribution chart, dashboard Row 6.

Section 5: Evidence Behind Every Decision

The table below maps each recommended action to its supporting data point and the exact location in the dashboard where it can be verified.

Decision	Supporting Number	Where in Dashboard
Target low-converting countries with transcript support	28.6% combined conversion rate for two high-volume countries. India: 77.5% for comparison.	Conversion Rate table
Rebalance counselor workload	Lead counselor: 68.9% share. Lowest counselor: 4.7% share.	Counselor Workload pie chart
Concentrate campaigns on Fall and Winter	Fall 2024: 1,459 applications. Summer 2025: 50 applications.	Applications by Term bar chart
Scale the follow-up protocol to all pending applicants	148 Follow Up records. All 148 produced an admitted student.	Outcome Distribution bar chart
Protect and maintain investment in top-volume country	2,684 total applications. 77.5% conversion rate.	Country Volume chart + Conversion Rate table

Conclusion

The dashboard turns three weeks of data work into a tool any team member can use. The five findings. Fall dominance, channel concentration, country conversion gaps, counselor imbalance, and the 100% follow-up rate , all connect directly to specific numbers. The four recommendations are actionable today. None require additional data collection. All are verifiable in the dashboard using the filter controls.

Skills and Tools Used

Tool / Skill	How It Was Applied
Looker Studio	Dashboard design, filter configuration, calculated conversion rate field, conditional colour formatting
Python (pandas, matplotlib)	Underlying data cleaning and exploratory analysis completed in Weeks 1 and 2

Dashboard Design Principles	Layout structured top-to-bottom from summary to detail. Each row answers one question.
Data Storytelling	Findings translated from chart outputs into plain-language conclusions and numbered recommendations
Conversion Rate Analysis	Calculated as admitted records divided by total records, applied per country
Chart Type Selection	Each visualisation type matched to the structure of the data it
